Description

Having removed an identity that was most likely used in a server in the network view causes a crash in the client. Thus I can't access my network view at all currently.

We're using Quassel core v0.12.4 and Quassel client v0.12.3.

- Status changed from New to Resolved

I'm not entirely sure when this was fixed (possibly in <https://github.com/quassel/quassel/pull/549>) but this seems to not be broken anymore.

The behavior now seems to be that when an identity in use on a network is deleted, another identity is automatically chosen for that network. From what I can tell, the identity that with the lowest ID number in the identity table is selected.

Either way, I believe this bug is fixed. If you continue to see this issue, please reopen this bug! Thanks for the report!
